

WRITE once. RUN anywhere.

Java is the **go-to programming language** for enterprise application development. Java's "write once, run anywhere" platform independence makes it an excellent solution for organizations that have diverse hardware platforms, including: Linux, Mac and Windows.

What is "Write Once. Run Anywhere."?

Write your Java code on a Windows box and deploy it to Linux, or vice versa. The Java Virtual Machine ensures that your development investment is going to run on the broadest range of platforms and the best part of all, no re-compiling. Pretty cool, huh?

Work Anywhere.

Over 80,000 jobs currently available for Java Developers, now that's opportunity!

Technical Training by i-kuw solutions!

Find a course and get to writing.

FIND A
COURSE

"I just want to say that I'm really impressed with this class. Like I said earlier, I've always HATED online classes, but I've never had one with a live instructor and this much interaction. This is better than the Ada class I took in July, and it was actually in a classroom." - CHARLES W.
